Title : Exe12 - Confidence Intervals NHANES Exercise

Name: Ooi Caaron

IC Number: 990701-07-5837

Date : 16/7/2023

Introduction : Exercise about data frame using pandas

Conclusion :Still need to practice more and do revision

Exercise 1: Confidence Intervals - NHANES

This exercise, we are going to practice on how to load data, clean/manipulate a dataset, and construct a confidence interval for the difference between two population proportions and means.

We will use the 2015-2016 wave of the NHANES data for our analysis.

For our population proportions, we will analyze the difference of proportion between female and male smokers. The column that specifies smoker and non-smoker is "SMQ020" in our dataset.

For our population means, we will analyze the difference of mean of body mass index within our female and male populations. The column that includes the body mass index value is "BMXBMI".

Additionally, the gender is specified in the column "RIAGENDR".

In [30]:

```python
import pandas as pd
import numpy as np
import matplotlib
matplotlib.use('Agg')
import seaborn as sns
%matplotlib inline
import matplotlib.pyplot as plt
import statsmodels.api as sm
```

In [31]:

```python
url = "nhanes_2015_2016.csv"
da = pd.read_csv(url)
da
```

Out[31]:

	SEQN	ALQ101	ALQ110	ALQ130	SMQ020	RIAGENDR	RIDAGEYR	RIDRETH1	DMD(
0	83732	1.0	NaN	1.0	1	1	62	3	
1	83733	1.0	NaN	6.0	1	1	53	3	
2	83734	1.0	NaN	NaN	1	1	78	3	
3	83735	2.0	1.0	1.0	2	2	56	3	
4	83736	2.0	1.0	1.0	2	2	42	4	
...	...	...	...	...	...	...	...	...	
5730	93695	2.0	2.0	NaN	1	2	76	3	
5731	93696	2.0	2.0	NaN	2	1	26	3

5733	93700	NaN	NaN	NaN	1	1	35	3	
5734	93702	1.0	NaN	2.0	2	2	24	3	

5735 rows × 28 columns

◀ |▬▬▬▬▬▬▬▬▬▬▬▬▬▬▬▬▬▬▬▬▬▬▬▬▬▬▬▬▬| ▶

Investigating and Cleaning Data

Create a new column named 'SMQ020x' and store data from column 'SMQ020' with following replacements:

- 1 to "Yes"
- 2 to "No"
- 7 to NaN
- 9 to NaN

In [32]:

```python
da['SMQ020x'] = da['SMQ020']
reset = {1:'Yes', 2:'No',7: None,9: None}
da = da.replace({'SMQ020x':reset})
da['SMQ020x']
```

Out[32]:

```
0        Yes
1        Yes
2        Yes
3         No
4         No
        ...
5730     Yes
5731      No
5732     Yes
5733     Yes
5734      No
Name: SMQ020x, Length: 5735, dtype: object
```

Create a new column named 'RIAGENDRx' and store data from column 'RIAGENDR' with following replacements:

- 1 to "Male"
- 2 to "Female"

In [33]:

```python
da['RIAGENDRx'] = da['RIAGENDR']
reset = {1: "Male", 2: "Female"}
da = da.replace({"RIAGENDRx": reset})
da['RIAGENDRx']
```

Out[33]:

```
0         Male
1         Male
2         Male
3       Female
4       Female
         ...
5730    Female
5731      Male
5732    Female
5733      Male
5734    Female
Name: RIAGENDRx, Length: 5735, dtype: object
```

Drop all NAs from both `SMQ020x` & `RIAGENDRx` and store into a new dataframe named 'dx'. Plot the following crosstab using `pd.crosstab` library.

In [34]:

```python
dx = da[da['SMQ020x'] != None]
pd.crosstab(dx['SMQ020x'], dx['RIAGENDRx'])
```

Out[34]:

RIAGENDRx	Female	Male
SMQ020x		
No	2066	1340
Yes	906	1413

Replace `dx['SMQ020x']` "Yes" to 1 and "No" to 0.

In [35]:

```python
reset = {'Yes': 1, 'No':0}
dx = dx.replace({'SMQ020x':reset})
dx = dx[['SMQ020x','RIAGENDRx']]
dx
```

Out[35]:

	SMQ020x	RIAGENDRx
0	1.0	Male
1	1.0	Male
2	1.0	Male
3	0.0	Female
4	0.0	Female
...	...	...
5730	1.0	Female
5731	0.0	Male
5732	1.0	Female
5733	1.0	Male
5734	0.0	Female

5735 rows × 2 columns

Calculate the 'mean' and 'size' and store into a new dataframe called `dz`

In [37]:

```python
dz = dx[['SMQ020x','RIAGENDRx']].groupby('RIAGENDRx').agg(['mean','size'])
dz
```

Out[37]:

	SMQ020x	
	mean	size
RIAGENDRx		
Female	0.304845	2976
Male	0.513258	2759

Constructing Confidence Intervals

Now that we have the population proportions of male and female smokers, we can begin to calculate confidence intervals. From lecture, we know that the equation is as follows:

$$Best\ Estimate \pm Margin\ of\ Error$$

Where the *Best Estimate* is the **observed population proportion or mean** from the sample and the *Margin of Error* is the **t-multiplier**.

The equation to create a 95% confidence interval can also be shown as:

$$Population\ Proportion\ or\ Mean\ \pm (t - multiplier * Standard\ Error)$$

The Standard Error is calculated differently for population proportion and mean:

$$Standard\ Error\ for\ Population\ Proportion = \sqrt{\frac{Population\ Proportion * (1 - Population\ Propor}{Number\ Of\ Observations}}$$

$$Standard\ Error\ for\ Mean = \frac{Standard\ Deviation}{\sqrt{Number\ Of\ Observations}}$$

Lastly, the standard error for difference of population proportions and means is:

$$Standard\ Error\ for\ Difference\ of\ Two\ Population\ Proportions\ Or\ Means = \sqrt{SE^2_{Proportion\ 1} +}$$

Difference of Two Population Proportions

Calculate the standard error for female

In [38]:

```python
import math
p = dz['SMQ020x']['mean']['Female']
n = dz['SMQ020x']['size']['Female']
sef = math.sqrt(p*(1-p)/n)
sef
```

Out[38]:

0.008438475404634192

Calculate the standard error for male

In [48]:

```python
p = dz['SMQ020x']['mean']['Male']
n = dz['SMQ020x']['size']['Male']
sem = math.sqrt((p*(1-p))/n)
sem
```

Out[48]:

0.009515714829783395

Calculate the difference between these two Standard Errors

In [49]:

```python
dse = math.sqrt(sef**2+sem**2)
dse
```

Out[49]:

0.012718360581316123

Calculate the confidence Interval

In [50]:

```python
ci = dz['SMQ020x']['mean']['Male'] - dz['SMQ020x']['mean']['Female']
x = ci-2*dse
y = ci+2*dse
print(x,y)
print(dse)
```

```
0.1829763204770033 0.23384976280226777
0.012718360581316123
```

Difference of Two Population Means

Now we look into the differences between 2 population means

In [42]:

```python
da["BMXBMI"].head()
```

Out[42]:

```
0    27.8
1    30.8
2    28.8
3    42.4
4    20.3
Name: BMXBMI, dtype: float64
```

In [52]:

```python
x = da[['BMXBMI','RIAGENDRx']].groupby('RIAGENDRx').agg(['mean','std','size'])
x
```

Out[52]:

	BMXBMI		
	mean	std	size
RIAGENDRx			
Female	29.939946	7.753319	2976
Male	28.778072	6.252568	2759

Calculate the Standard Error for Mean for both female and male

In [54]:

```python
s = x['BMXBMI']['std']['Female']
n = x['BMXBMI']['size']['Female']
semf = s/math.sqrt(n)
s = x['BMXBMI']['std']['Male']
n = x['BMXBMI']['size']['Male']
semm = s/math.sqrt(n)
print(semf,semm)
```

```
0.14212522940758335 0.11903715722332033
```

Calculate the difference between 2 Standard Error for Mean

In [56]:

```python
dsem = math.sqrt(semf**2+semm**2)
dsem
```

Out[56]:

```
0.18538992862064455
```

The difference between two means for male and female

In [57]:

```python
dbm = math.sqrt(x['BMXBMI']['mean']['Female']**2+x['BMXBMI']['mean']['Male']**2)
dbm
```

Out[57]:

41.52803607359479

Calculate the confidence interval between two population means

In [58]:

```python
cipm = x['BMXBMI']['mean']['Female']-x['BMXBMI']['mean']['Male']
y = cipm-2*dsem
z = cipm+2*dsem
print(y,z)
```

0.7910936830856763 1.5326533975682544
